Ideation & Problem Definition

Project ideation, stakeholder needs, and problem framing

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

1. Project context

This project uses Tableau Public to explore Olympic-related performance data through three decision-oriented dashboards: National Olympic Committee (NOC) performance, financial and strategic planning, and talent analytics. The supplied dashboards present the dataset as a global Olympic story spanning 1992–2026.

2. Problem statement

Olympic performance data can be difficult to interpret when medal counts, athlete participation, regions, sport categories, host status and investment indicators are spread across separate tables. Stakeholders need a compact visual way to compare performance, identify patterns and frame follow-up questions.

3. Project objectives

• Create interactive visual summaries from the supplied Olympic datasets.

• Compare medal outcomes across countries/NOCs, regions, sport categories and years.

• Explore how host-nation status, investment tier and athlete-related measures appear alongside medal outcomes.

• Build three dashboards aligned to distinct stakeholder scenarios.

• Communicate observations without presenting correlation as proof of causation.

4. Scope and boundaries

Included: descriptive analysis of four supplied CSV datasets, Tableau worksheets/dashboards, visual comparison, and documentation. Excluded unless separately completed: causal inference, verified national budget data, external validation of every record, and proof that hosting or investment directly causes medal outcomes.

5. Intended users

• National Olympic Committee analysts reviewing medal performance.

• Sports administrators considering resource allocation and participation.

• Talent-development teams exploring athlete and sport-category patterns.

- Students and data-analytics learners using dashboards for exploratory analysis.
