Solution Requirements

Functional, data, usability, and quality requirements

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

Functional requirements

• FR-01: Present country/NOC performance using medal measures.

• FR-02: Support comparison across years, regions and sport categories where fields are available.

• FR-03: Display investment tier and medal-efficiency indicators for the financial-planning scenario.

• FR-04: Show host-nation and other-country medal comparisons using the supplied host_nation indicator.

• FR-05: Present athlete-level measures including training hours, professional-athlete status, age at peak and medal totals where relevant.

• FR-06: Provide three separate scenario dashboards published through Tableau Public.

Data requirements

Use the supplied files: alltime_country_rankings.csv, athletes.csv, games_summary.csv and medal_results.csv. Preserve original source files and document field meanings. Check data types, missing values, duplicate keys and consistency between related tables before making claims.

Usability requirements

• Use descriptive dashboard titles and chart labels.

• Use consistent region/category naming and legible legends.

• Make comparison units and year range clear.

• Avoid implying that investment or host status causes medal outcomes.

Quality and limitations

Accuracy depends on the supplied dataset. The games_summary file has 18 records and years from 1992 through 2026; its year sequence should not be assumed to represent every calendar year. The dashboard export labels and chart encodings should be reviewed against the underlying workbook before final submission.

Acceptance checks

- All three dashboard links open and show the intended scenario.
- Titles and chart labels match the intended business question.
- Filters/legends function as expected in the live workbook.
- Counts and sums reconcile with the selected source data or are documented when different aggregation rules apply.
- No unsupported causal or externally verified claims are presented.
