Data Flow & User Stories

Project data flow and scenario-based user stories

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

High-level data flow

1. Source: four supplied CSV datasets. 2. Inspection: identify dimensions and measures. 3. Analysis: select relevant fields and aggregations for each scenario. 4. Visualisation: create charts and combine them into dashboards. 5. Delivery: publish Tableau Public views and include static PDF previews. 6. Review: validate calculations, filters, titles and limitations.

User stories

• As an NOC analyst, I want to compare country medal totals and medal composition so that I can identify relative performance patterns.

• As a sports planner, I want to view medal efficiency alongside investment tiers so that I can identify cases for further investigation.

• As a programme manager, I want to compare host-nation medal outcomes with other countries so that I can examine possible hosting-related patterns.

• As a talent analyst, I want to explore training hours, professional status and sport categories alongside medal outcomes so that I can generate hypotheses for athlete development.

• As a reviewer, I want clear labels, data sources and limitations so that I can interpret the dashboards responsibly.

Data model notes

The files contain country/NOC identifiers, years, regions, athlete IDs and descriptive measures. If connecting tables, verify keys and relationship cardinality to avoid duplicated medal totals. Athlete-level and country-year-level tables are at different grains and should not be joined blindly.

Risks to manage

• Different data grains can inflate totals if tables are joined incorrectly.

• The dataset appears curated/synthetic in some fields; provenance and external validity are not independently verified here.

• The dashboards’ visible labels sometimes use 1992–2026 while games_summary has only 18 rows; use the actual data records rather than assuming continuous annual observations.
