Project Proposal

Global Olympic Sports Performance Analysis

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

Executive summary

The project delivers a Tableau Public visual analytics experience for Olympic performance data, organised around three scenarios: NOC performance, financial and strategic planning, and talent analytics. It is designed as a skill-learning project in Tableau and data analytics.

Problem and opportunity

Raw tables contain country rankings, athlete-level attributes, Games summaries and country/year medal results. Dashboards provide a visual layer to compare outcomes and identify patterns that merit further investigation.

Proposed solution

• Scenario 1: NOC Performance — country performance, sport-category medal measures, athlete participation and medal distribution.

• Scenario 2: Financial & Strategic Planning — investment-efficiency matrix, regional capital allocation, host advantage impact and human-capital efficiency indicators.

• Scenario 3: Talent Analytics — total medals across Games, host versus other countries, host-country performance during hosting years and regional medal distribution.

Deliverables

Three published Tableau Public dashboards; source CSVs; dashboard PDF previews; phase-based documentation PDFs; and a repository-ready project structure.

Success criteria

A reviewer can open each dashboard, understand the scenario and key measures, trace the analysis to the provided datasets, and identify caveats. GitHub publication remains a pending task until a repository URL is available.

Project constraints

The analysis is limited to the supplied dataset and the visible dashboard exports. It does not establish causal effects of investment or hosting, nor does it independently verify the dataset against official Olympic records.
