Tableau Performance & Quality Test Plan

Verification plan and evidence-based status

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

Purpose

Define checks for data correctness, dashboard usability, link availability and reasonable performance before repository submission.

Test cases

• T01 — Open each of the three Tableau Public links in a signed-out/private browser session where possible. Expected: view loads or access requirement is documented.

• T02 — Compare dashboard title and PDF preview. Expected: scenario title and main chart set match.

• T03 — Verify medal totals against the relevant source table and aggregation. Expected: totals reconcile at the correct grain.

• T04 — Check filters and legends. Expected: selections update relevant charts consistently.

• T05 — Check labels, axis units, dates and category names. Expected: no ambiguous or clipped labels.

• T06 — Test initial load and interactions on a normal connection. Expected: usable load without excessive delay; record measured time if formally tested.

• T07 — Review all claims for causal overstatement. Expected: observational patterns are described as associations.

Evidence status

The three static dashboard PDFs and public links are supplied. No measured load-time results, formal test logs, browser matrix or completed acceptance-test evidence were supplied. Therefore, this document is a project-specific test plan, not a claim that every test has passed.

Known quality risks

Different table grains, potential duplicated totals after relationships/joins, the distinction between medals and medal points, and the need to verify year labels/coverage.

Test record template

For each test, record date, dashboard, browser/device, steps, expected result, actual result, pass/fail, screenshot or note, and corrective action.
