Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

Abstract

This project presents a Tableau Public analysis of Olympic-related performance data through three dashboards: NOC Performance, Financial & Strategic Planning, and Talent Analytics. It is a learning project focused on data analysis and visual storytelling.

Introduction

Olympic performance can be explored through medal totals, athlete participation, sport categories, regional distributions, host status and investment-related indicators. Visual analytics helps users compare these dimensions and formulate more specific questions.

Objectives

• Develop three focused dashboards from supplied CSV datasets.

• Present country/NOC, regional, temporal, investment-tier and athlete-related views.

• Improve communication of patterns through charts and dashboard layouts.

• Document data sources, scope, caveats and future improvements.

Data sources and observed inventory

The supplied files contain 60 country ranking records, 8,000 athlete records, 18 Games summary records and 910 country/year medal-result records. The Games summary covers years from 1992 to 2026. These counts are based on the provided CSVs and may change if source files are updated.

Dashboard overview

• Scenario 1 — NOC Performance: country performance, sport-category medal measures, athlete participation and medal distribution.

• Scenario 2 — Financial & Strategic Planning: investment-efficiency matrix, regional capital allocation, host advantage and human-capital efficiency indicators.

• Scenario 3 — Talent Analytics: medal trends across Games, host-versus-other comparison, hosting-year performance and regional medal distribution.

Illustrative dataset observations

In alltime_country_rankings.csv, the first five rows by overall_rank are United States (735 medals), China (696), Russia (429), Great Britain (401) and Germany (336). In medal_results.csv, summed total_medals by region are Europe 2,822; Asia 1,516; North America 993; Oceania 320; Africa 147; Europe/Asia 144; South America 83. These are calculations over the supplied dataset, not independently verified official Olympic totals.

Methodology

The workflow is file-based: inspect CSV fields, select measures relevant to each scenario, build visualisations in Tableau Public, assemble dashboards, publish views and export PDF previews. The precise workbook relationships, calculated fields and filters should be checked in the Tableau workbook before treating any metric as fully reproducible.

Limitations

Dataset provenance and official-source accuracy are not independently established in this report. The dataset includes a 2026 record and years that may not correspond to every calendar year. Investment tiers and host indicators show associations only. Athlete-level and country-year tables have different grains and can produce incorrect totals if joined improperly.

Conclusion

The three dashboards provide a structured way to explore Olympic performance, planning indicators and talent analytics. The project demonstrates the application of Tableau to a multi-file dataset. Further work should validate source data, document workbook calculations, conduct user testing, and publish the complete project repository.

Future enhancements

• Add a detailed data dictionary and source provenance.

• Document joins/relationships and calculated fields.

• Add metric definitions and clear denominators for efficiency measures.

• Conduct formal usability and performance testing.

• Add reproducible workbook and a GitHub repository URL once published.

Dataset inventory

Dataset	Rows	Columns	Role
alltime_country_rankings.csv	60	13	Country/NOC ranking and medal totals
athletes.csv	8000	26	Athlete attributes and performance
games_summary.csv	18	10	Games, hosts and participation
medal_results.csv	910	19	Country-year medals and planning indicators
