Scalability & Future Plan

Practical improvements beyond the current Tableau project

Student	Hussain Hattpipliya Wala
Institution	MEDI-CAPS University
Programme	Bachelor of Computer Applications (BCA)
Year / Semester	Second Year / Third Semester
Project	Global Olympic Sports Performance Analysis
Analytics tool	Tableau Public

Near-term improvements

• Include the Tableau workbook file in the repository where sharing is permitted.

• Add a data dictionary defining every field and aggregation.

• Record source provenance, licences and any preprocessing.

• Validate country/year medal totals and data grain.

• Check dashboard accessibility, labels, load time and filter behaviour.

Medium-term improvements

• Create a repeatable data-cleaning workflow and retain raw versus cleaned copies.

• Use explicit relationships between athlete, Games and country-year tables.

• Add per-athlete or per-participation normalised measures only with clear denominators.

• Add comparison periods and filters that make the time coverage transparent.

• Run a short usability test with representative reviewers.

Long-term opportunities

• Refresh data from documented official sources if permitted.

• Add context such as event counts, sport participation and population-adjusted metrics only when reliable sources are available.

• Build a repeatable update process and quality checks.

• Create a narrative presentation that distinguishes descriptive analytics from causal evaluation.

Constraints

These are proposed future enhancements, not completed capabilities. Current delivery is based on static CSV sources and published Tableau views.
